

### FEATURES

- Automatically restarts microprocessor after power failure
- Monitors pushbutton for external override
- Internal circuitry debounces pushbutton switch
- Maintains reset for 350ms after  $V_{CC}$  returns to an in-tolerance condition or pushbutton released
- Accurate 10% or 15% microprocessor 3.3V power supply monitoring
- Reduces need for discrete components
- Precision temperature-compensated voltage reference and voltage sensor
- Low-cost TO-92 package or surface mount SOT-223 package
- Internal 5k $\Omega$  pull-up resistor
- Operating temperature of -40°C to +85°C

### PIN DESCRIPTION

PIN 1	$\overline{\text{GROUND}}$
PIN 2	$\overline{\text{RESET}}$
PIN 3	$V_{CC}$
PIN 4	$\overline{\text{GROUND}}$ (SOT-223 ONLY)

### DESCRIPTION

The DS1233A EconoReset monitors two vital conditions for a microprocessor: power supply and external override. A precision temperature-compensated reference and comparator circuit are used to monitor the status of the power supply ( $V_{CC}$ ). When an out-of-tolerance condition is detected, an internal power fail signal is generated which forces reset to the active state. When  $V_{CC}$  returns to an in-tolerance condition, the reset signal is kept in the active state for approximately 350ms to allow the power supply and processor to stabilize. The second function of the DS1233A is pushbutton reset control. The DS1233A debounces a pushbutton closure and will generate a 350ms reset pulse upon release.

### OPERATION — POWER MONITOR

The DS1233A provides the functions of detecting out-of-tolerance power supply conditions and warning a processor-based system of impending power failure. When  $V_{CC}$  is detected as out-of-tolerance as defined by the tolerance of the part selected, the  $\overline{\text{RST}}$  signal is asserted. On power-up,  $\overline{\text{RST}}$  is kept active for approximately 350ms after the power supply has reached the selected tolerance. This allows the power supply and microprocessor to stabilize before  $\overline{\text{RST}}$  is released.

## OPERATION — PUSHBUTTON RESET

The DS1233A provides for a pushbutton switch to be connected to the  $\overline{\text{RST}}$  output pin. When the DS1233A is not in a reset cycle, it continuously monitors the  $\overline{\text{RST}}$  signal for a low-going edge. If an edge is detected, the DS1233A will debounce the switch by pulling the  $\overline{\text{RST}}$  line low. After the internal timer has expired, the DS1233A will continue to monitor the  $\overline{\text{RST}}$  line. If the line is still low, the DS1233A will continue to monitor the line looking for a rising edge. Upon detecting a release, the DS1233A will force the  $\overline{\text{RST}}$  line low and hold it low for 350ms.

### NOTE:

For proper operation with an external pushbutton, a capacitor between 100pF and 0.01 $\mu$ F must be connected between  $\overline{\text{RST}}$  and ground. In applications where additional reset current is required, a minimum capacitance of 500 pF should be used, along with a parallel external pull-up resistor of 1k $\Omega$  minimum.
